

Browser Testing Comparison

When comparing the same webpage across different browsers (Chrome, Firefox, and Edge). I noticed several differences in how content was rendered. Between Chrome and Firefox, colors appeared sharper and images looked more defined in Firefox. I also encountered an issue with an `<h2>` element labeled "Contact Form" that was hidden in the HTML, it remained visible in Firefox initially, which required me to revise my HTML code to correct it. The "Choose your State" dropdown looked different across browsers as well: when hovering over states, Firefox highlighted the selection with a light gray, Chrome used a royal blue, and Edge displayed a dark gray highlight. Aside from these styling differences, there were no major functional issues or layout problems across the browsers.
